

CANE  CREEK®

We are a company of riders...

From our roots with the world's first threadless headset to the introduction of the eeWings titanium crankset, we have always approached cycling from a rider's perspective – with wonder and curiosity.

Riding a bike isn't just something we do, it's part of who we are – enriching our lives every time we sit in the saddle. It's our therapist, our best friend, our link to the kid in all of us – smiling from ear to ear pedaling to the end of the block and back for the first time. For us, being on a bike is joy and we know that the dedicated riders who choose Cane Creek products feel the same way.

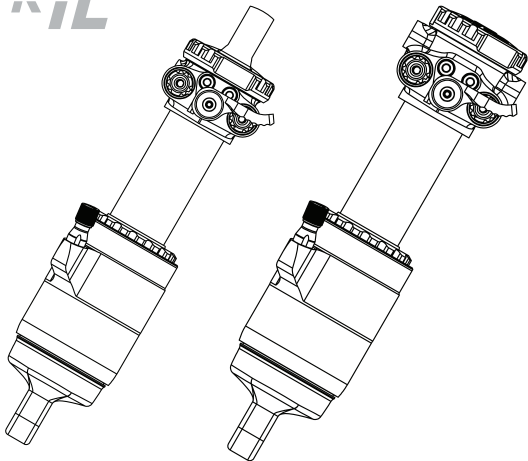

For that reason, we strive to constantly make the act of riding better – in whatever form that may take. This is the lens we look through when we conceive, design, test and manufacture Cane Creek components. We look to the rider – to ourselves – on the bike and ask, "How will this improve the ride?"

It's our belief that a cycling component brand must be about more than just balance sheets, income statements and manufacturing quotas. Simply because a product may be profitable doesn't mean it's worth making. If it does nothing to make riding better – through innovative design, superior performance and quality craftsmanship – then, simply put, we don't do it.

At Cane Creek we are riders first and we know the difference that cycling makes in our lives and our customers lives. We know that every time someone chooses a Cane Creek product they are choosing to trust us with something that makes their life better.

We will honor that trust by making sure that every product we release – from a simple bearing to a four-way adjustable shock – is the best it can possibly be.

Safety and Warnings

The rear shock is an important part of your bike. Before installing and using your new rear shock, refer to your bicycle manufacturer for coil shock compatibility and carefully read this owner's manual to learn the correct installation and adjustment procedures of the shock.

Warning

Cane Creek DOES NOT recommend the use of COIL IL rear shocks on a Clevis mounting frame design.

Warning

Improperly installed and/or adjusted shocks can cause serious harm or death and may severely damage your bike.

Warning

A broken or malfunctioning shock may cause loss of vehicle control and result in **SERIOUS INJURY OR DEATH**. If the shock ever loses oil, air or makes unusual noises, stop riding and have the shock inspected by a Cane Creek Authorized Suspension Service Center or call the Cane Creek Customer Service Team.

Warning

Modification, improper service or use of aftermarket replacement parts voids the warranty and may cause the shock to malfunction, resulting in loss of vehicle control and **SERIOUS INJURY OR DEATH**. Do not

Safety and Warnings

modify your bike frame or shock. Use only genuine Cane Creek Double Barrel parts.

Follow service maintenance recommendations. Shock service should be performed by Cane Creek Cycling Components or a Cane Creek Authorized Suspension Service Center. Visit www.CaneCreek.com or contact us at **828-641-9560** to locate a Cane Creek Authorized Suspension Service Center or for the most up to date revisions.

Cane Creek rear shocks contain a nitrogen charge in the reservoir. Opening a nitrogen pressurized shock is dangerous and can result in **SERIOUS INJURY OR DEATH**. The shock should only be opened by a Cane Creek Authorized Suspension Service Center.

Cane Creek rear shocks are manufactured exclusively for the bike model for which they are ordered. Switching units between different bikes may not only decrease the shocks performance but might also cause damage to the bike and can result in **SERIOUS INJURY OR DEATH**. Always contact Cane Creek or Cane Creek Authorized Suspension Service Center to verify compatibility before switching a shock from one bike to another.

Any improper servicing procedure with a Cane Creek shock with “stuck down” condition can lead to **SERIOUS INJURY OR DEATH**. Contact Cane Creek or an Authorized Suspension Service Center for repair.

Introduction and Registration

Congratulations on the purchase of your Cane Creek Double Barrel rear shock.

Cane Creek has been supplying revolutionary suspension technology to the bicycle market since 2005. Based on a foundation of precision quality and cutting-edge innovation, our rear shocks represent the pinnacle of high-performance bicycle suspension systems. Cane Creek technology offers the broadest adjustment range available giving you the control to tune your shock, your way, for your bike. This owner's manual is your reference guide to understanding and tuning your rear shock. It also provides important information about proper installation, set-up and maintenance of your shock.

For product registration or questions, visit **www.CaneCreek.com** or contact the Cane Creek Rider Engagement Team ready to help you at 800-234-2725.

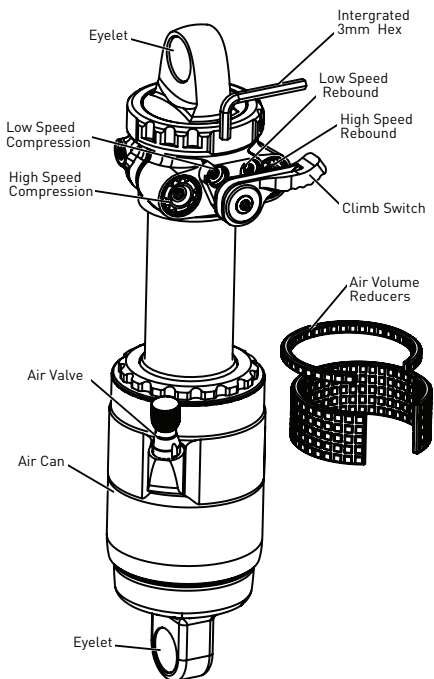

Features Overview

END EYE	Open ID	ID w/Bushing	Trunnion
Air & Coil	15.02mm	12.7mm	54mm Width / M10 Threads
Damper Adjustments	Adjuster	Abbreviation	Adjustments
3mm adjustment tool integrated with climb switch			
Air & Coil	Low Speed Compression	LSC	25 clicks
	Low Speed Rebound	LSR	25 clicks
	High Speed Compression	HSC	4.5 turns
	High Speed Rebound	HSR	4.5 turns
	Climb Switch	CS	2 positions
Spring Rates	Minimum	Maximum	Sag
Air Pressure	50psi	350psi	Recommended 25% - 35%
Coil Preload	1 turn = 3 clicks	6 turns = 18 clicks	

Count of adjuster positions may vary slightly with some shock builds. The range of adjustment will remain the same.

Product Anatomy

AIRIL

Product Anatomy

Adjuster Basics

Compression and Rebound are settings used to control the speed at which the shock is compressed and uncompressed during suspension events. When adjusting these settings, you are adjusting the rate of oil flow in the shock damper system. A Cane Creek "DB" shock has the following settings.

Low Speed Compression (LSC) - Shaft compression during most compression events. (i.e. Most bumps in a trail or pedal "bob")

High Speed Compression (HSC) - Shaft compression during quick and large compression events. (i.e. Hard landing or deep compression)

Low Speed Rebound (LSR) - Shaft rebound speed during most rebound events (i.e. Recovering from compression cycles caused by pedaling or bumps.

High Speed Rebound (HSR) - Shaft rebound speed during quick and large rebound events, typically deep in the shock's travel. (i.e. Recovering from a hard landing or taking off from a jump lip)

Integrated 3mm Tool - All damper adjusters use a 3mm hex tool which is integrated to the CS lever and held in place with magnets. Check that the tool is properly secured at every ride and ensure that both the tool and lever are clean and free of debris when re-installing the 3mm tool.

Adjuster Basics

Climb Switch-

1 - **“Open”** setting.

The lever does not add any additional damping to the shock - only the adjusters on the front face of the shock are influencing the shock's movement in this setting.

2 - **“Climb”** setting

The lever closes the Low Speed circuit of the shock in this setting, creating a firmer feel and stops the shock from bobbing in pedaling scenarios. This setting is designed for on-trail climbing support where the shock is still active during fast impacts (i.e.. fallen log, roots, rocks) but removes the rider influenced soft bump absorption.

When backing out your adjusters, **BE CAREFUL NOT TO OVER-TORQUE.** When you feel resistance - **STOP.**

You won't feel a hard stop, you will feel resistance.

Turning farther **WILL DAMAGE YOUR SHOCK.**

Turning an adjuster counter clockwise will open the circuit which allows more oil flow. (open compression = soft compression / open rebound = fast return speed). Turning an adjuster clockwise will close the circuit and restrict oil flow. (closed compression = firm compression / closed rebound = slow return speed).

Frame Clearance

It is critical to check for clearance between your frame and shock at all points of travel during installation of the shock. The eye to eye and stroke measurements of the shock must match what is specified and approved by the frame manufacturer.

Follow the steps below carefully to ensure proper clearances and avoid damage.

AIR - These steps must be followed when installing a new shock to ensure proper clearance between your frame and the shock at all points of travel.

1. Install the shock to your frame using the appropriate hardware as specified by your frame manufacturer. Refer to installation section (pg.14).
2. With a shock pump attached to the air valve, slowly release the air pressure in the shock. Up to 50psi may be left in the shock if desired. Ensure that the Climb Switch is in the off position.

3. Slowly compress the suspension fully through its travel while ensuring there is no interference between the shock and the frame. If needed, the air can be rotatable by hand or with strap wrench for best alignment of the air valve.

Frame Clearance

4. If there is sufficient clearance, add air pressure back to the shock. Recommended starting air pressure is 120% of riders body weight (lbs) in psi. Example - 180lbs rider x 1.2 = 216psi. Cycle the shock 10-20 times through at least 30% of its travel to equalize the positive and negative pressure. Check and adjust the air pressure again after equalizing as some pressure will have transferred to the negative chamber.

COIL - These steps must be followed when installing a new shock to your frame to ensure proper clearance between your frame and the shock at all points of travel.

1. Remove the spring from the shock and install only the spring clip. Refer to coil installation section (pg.21).
2. Install the shock to your frame using the appropriate hardware as specified by your frame manufacturer. Ensure that the Climb Switch is in the off position.
3. Slowly compress the suspension fully through its travel while ensuring there is no interference between the shock and the frame.
4. If there is sufficient clearance, remove the shock to install the coil.
5. Reinstall the complete shock to the frame to set sag.

Installation

Installation of the shock requires the use of the appropriate hardware for your specific frame. The mounting points of the shock are a standardized size and additional hardware is typically needed to fit the shock to each frame. Shock hardware may be needed to properly take up the width and thickness of the frame's mounting points and bolts. The size and type of shock hardware required should be listed by the manufacturer or by measuring the existing hardware on the original shock.

For eyelet bushing and hardware installation information, please visit www.CaneCreek.com.

Installation

1. With the appropriate hardware installed to the shock eyelets, mount the shock to the frame by first inserting the mounting bolts. Do not force the shock in place if there is any fitment interference with the frame.

2. Torque all mounting bolts to the frame manufacturer's specifications.

3. Ensure all hardware is secure and there is no side to side movement allowed at either mounting point.

Setting Sag

Sag is the point at which your shock is compressed under neutral riding weight. This is the most important setting of your shock and will have the greatest impact on the shock's effectiveness. Typical recommended sag for shocks is between 25% and 35% of the shock's travel. The best setting for you will be determined by your specific ride feel and suspension kinematics. We recommend a starting point of 30% of shock travel but this may need to be adjusted to your needs.

For updated tutorials and suggestions, visit www.CaneCreek.com.

Air

Recommended starting air pressure is 120% of riders body weight (lbs) in psi.

Example - 180lbs rider x 1.2 = 216psi.

*This will vary between shock sizes and suspension kinematics.

1. With starting air pressure in the shock and the Climb Switch in the Open position, ensure the positive and negative air chambers are equalized by cycling the shock 10-20 times through at least 30% of its travel. Air pressure may decrease slightly after equalizing air chambers

Setting Sag

2. Slide the Travel Indicator O-ring to the shock body and mount the bike in your normal riding gear. Ensure the bike is on a level surface and your weight is centered over the bottom bracket as you are in a normal riding position.

3. Carefully dismount the bike without further compressing the suspension and measure the distance the O-ring has moved.

4. This distance is your sag amount and can be converted to a percentage with the following formula:

$$(\text{Sag} \div \text{Shock Stroke}) \times 100 = \text{Sag \%}$$

$$15\text{mm sag} \div 50\text{mm stroke} = 30\%$$

$$16.5\text{mm sag} \div 55\text{mm stroke} = 30\%$$

$$18\text{mm sag} \div 60\text{mm stroke} = 30\%$$

$$19.5\text{mm sag} \div 65\text{mm stroke} = 30\%$$

5. Add or remove air pressure as needed and repeat the process until desired sag amount is achieved.

Setting Sag

Coil

For a recommended starting coil weight, visit www.CaneCreek.com or contact the Cane Creek Rider Engagement Team ready to help you at 800-234-2725.

IMPORTANT

If less than 1 turn (3 clicks) of preload engagement yields not enough sag, you will need to change to a lower spring rate. If more than 2 turns (3 clicks) of preload are needed to achieve proper sag, although the coil spring itself can be preloaded up to 6 full turns before it will experience coil bind before the shock reaches full stroke, it is highly likely that you can achieve better performance from the shock with the next spring rate up if you require more than 3 turns of preload to reach your desired sag.

Increasing Spring Preload

Increasing the preload will increase the starting spring rate of the coil, as well as increasing ride height and reducing sag. To increase the preload on your spring, turn the Spring Adjustment Nut clockwise (no more than two full rotations).

Reducing Spring Preload

Reducing the preload will decrease the ride height and increase sag. To reduce the preload on your spring, turn the Spring Adjustment Nut counter-clockwise (Make sure the spring preload still has 1 full turn of preload engagement when reducing preload).

Setting Sag

1. With the shock uncompressed, measure the length of your shock from center of each mounting point.

2. Mount the bike in your normal riding gear. Ensure the Climb Switch is in the Open position, the bike is on a level surface, and your weight is centered over the bottom bracket as you are in a normal riding position.

3. Measure the shock from eye to eye in this position. The difference between the two measurements is your sag amount (uncompressed length - compressed length = sag) and can be converted to a percentage with the following formula.
$$\text{Sag} \div \text{Shock Stroke} \times 100 = \text{Sag \%}$$

E.g. $(16.5\text{mm} \div 55\text{mm stroke}) \times 100 = 30\%$
4. Add or remove spring pre-load as needed and repeat the process until desired sag amount is achieved.

Air Volume Adjustment

Air volume can be adjusted by adding volume reducing spacers inside of the air can. This adjustment causes the air spring to ramp up at the end of the shock's travel which will further increase the resistance to bottom out.

Air pressure should be only used to achieve the correct sag value. If the sag measurement of your air shock is correct (between 25-35% of the shock's stroke is compressed with the rider weight positioned properly on the bike) but the bike uses all of the shock's travel too easily or too frequently, consider adding a volume reduction spacer to the shock.

To install volume reduction spacers:

1. Slowly release air from the shock. **WARNING** Failure to remove air pressure before opening the shock body can result in serious injury.

2. With a pick or similar tool, carefully remove the metal retaining ring from under the air can.

Air Volume Adjustment

3. Pull the outer air canister down until it separates from the shock

4. Install the desired amount of volume reduction spacers
*Large volume reducer bands can be cut to smaller sections if needed.

Volume reducers should only be installed in the positive air chamber. Do not place anything in the negative air chamber (shown in image 4)

5. Reinstall the outer air can
*replace inner o-ring if there is any damage or wear

6. Reinstall the metal retaining ring ensuring that it is fully seated in the groove

7. Using a shock pump, inflate the shock and set sag

Coil Installation

Selecting the appropriate spring rate is an important variable in achieving optimal set-up of a coil shock. Your ideal spring rate will be based on rider weight, frame design, and riding style. (For spring weight calculation help, visit www.CaneCreek.com or call the Cane Creek Rider Engagement Team).

⚠ Warning

Riding on a spring that is not appropriate for your body weight can cause **SERIOUS INJURY OR DEATH** and damage to the bike and shock.

Spring Removal and Installation

To remove the spring, turn the spring adjustment nut counter clock wise to remove all preload on the spring. Remove spring clip from shock. Once the clip is removed, slide the spring off the shock. On frames with long mounting axles, it may be necessary to remove the mounting axle before the spring can be removed.

⚠ Warning

Always make sure the end of the spring's coil is aligned on the opposite side of the slot in the spring clip.

Service and Maintenance

Extreme usage like downhill racing or ebikes may shorten service intervals.

Service and Maintenance	Every Ride	15 Hours	100 Hours or annually
Check sag - Reset if necessary	X		
Clean and inspect shock exterior	X		
Clean with mild soap and water		X	
(AIR) Inspect external air sealing surfaces for scratches or damage.		X	
(AIR) Inspect and clean air valve threads to prevent dirt from entering air spring during inflation.		X	
(COIL) Clean around spring adjustment nut to prevent damage to the threads on shock body.		X	
Inspect mounting hardware and bushings.		X	
Service damper and air spring performed by a Cane Creek Authorized Service Center.			X

Warranty Information

LIMITED ONE (1) YEAR WARRANTY ON SUSPENSION PRODUCTS

Subject to the limitations, terms and conditions hereof, Cane Creek warrants, to the original retail owner of each new Cane Creek suspension product, that the Cane Creek suspension product, when new, is free from defects in materials and workmanship. This warranty expires one (1) year from the date of the original Cane Creek suspension product retail purchase from an authorized Cane Creek dealer or from a Cane Creek authorized Original Equipment Manufacturer where Cane Creek suspension is included as original equipment on a purchased bike, unless otherwise dictated by requirement of law.

TERMS OF WARRANTY

This warranty is conditioned on the Cane Creek suspension product being operated under normal conditions and properly maintained as specified by Cane Creek. This warranty is only applicable to Cane Creek suspension purchased new from an authorized Cane Creek source and is made only to the original retail owner of the new Cane Creek suspension product and is not transferable to subsequent owners. This warranty is void if the Cane Creek suspension product is subjected to abuse, neglect, improper or unauthorized repair, improper or unauthorized service or maintenance, alteration, modification, accident or other abnormal, excessive, or improper use. Should it be determined, by Cane Creek in its sole and final discretion, that a Cane Creek suspension product is covered by this warranty, it will be repaired or replaced, by a comparable model, at Cane Creek's sole option, which will be conclusive and binding.

Cane Creek components are designed for use only on bicycles that are pedal powered or pedal assisted.

This limited warranty does not apply to normal wear and tear, malfunctions or failures that result from abuse, neglect, improper assembly, alteration or modification, improper or unauthorized repair or maintenance, crash, accident or collision, or other abnormal, excessive or improper use.

Warranty Information

Wear and tear parts are subject to damage as a result of normal use, failure to service according to Cane Creek recommendations, and/or riding or installation in conditions or applications other than recommended.

Wear and tear parts include:

- Air sealing O-rings
- Bearings
- Bottom out pads
- Bushings
- Corrosion
- Dust seals
- Foam rings, Glide rings
- Rear shock mounting hardware and main seals
- Rubber moving parts
- Stripped threads/bolts (aluminum, titanium, magnesium or steel)
- Upper tubes (stanchions)

This warranty shall not cover damages caused by the use of parts of different manufacturers or parts that are not compatible or suitable for use with Cane Creek components.

THIS IS THE EXCLUSIVE REMEDY UNDER THIS WARRANTY. ANY AND ALL OTHER REMEDIES AND DAMAGES THAT MAY OTHERWISE BE APPLICABLE ARE EXCLUDED, INCLUDING, BUT NOT LIMITED TO, INCIDENTAL OR CONSEQUENTIAL DAMAGES OR PUNITIVE DAMAGES.

To the extent allowed by local law claims under this warranty must be made during the warranty period and within one (1) year following the date on which any such claim arises.

When making a claim under this Limited Warranty you will be required to provide to an authorized Cane Creek Warranty Center:

1. The Product (or the affected part) and
2. A copy of the original proof of purchase, which clearly indicates the name and address of the seller, the date and place of purchase, the product part number and if utilized, a serial number. If Cane Creek products are sold as part of a complete bicycle, the bicycle brand, model, model year, and serial number should be included.
